

Skip the Dip

50%

Up to half people above the age of 65 years have **asymptomatic bacteriuria**.

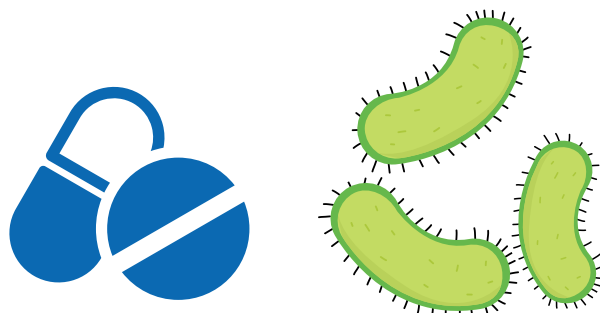

Older people with bacteria present in their urine

100% people with indwelling urinary catheters

Asymptomatic bacteriuria (ASB)

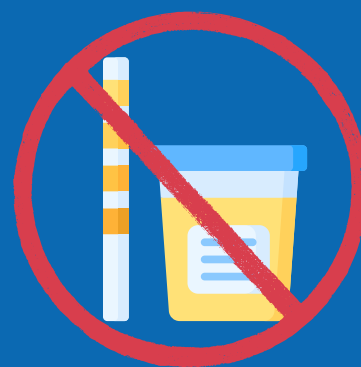

ASB isn't harmful to people but unnecessary antibiotic treatment can be. **1 in 3** people will get side-effects from antibiotics. Some will be at increased risk of developing antimicrobial-resistant infections in the future.

Over 65? Don't dip the urine!

The dipstick test and positive results are usually useless in detecting infection in the urine.

A positive dipstick test result cannot differentiate ASB from UTI.

Suspect a UTI?

Confirm it based on symptoms and signs of a UTI, and exclude other reasons. Follow a **clinical pathway** not a dipstick test result!
